

The LUNE experiment

-- A new scientific opportunity @ HIAF

尹航（华中师范大学）

On behalf of LUNE collaboration

高能缪子散射物理研讨会

September 20th, 2025

Proton: basic questions

- The origin of its **mass**?
 - Make up nearly 90% of the normal matter in the universe
 - Elementary valence quarks: 1% level contribution
- The origin of **confinement**?
 - Quarks hadronized and form protons as the universe cooled below Hagedorn temperature
- **Distribution of strong force**?
 - Keep quarks confined
 - Make protons stable particles

Fundamental global properties of proton

- The structure of strongly interacting particles can be probed using other fundamental forces
 - Electromagnetic, weak, gravity (in principle)

em:	$\partial_\mu J_{\text{em}}^\mu = 0$	$\langle N' J_{\text{em}}^\mu N \rangle$	$\longrightarrow$	Q_{prot}	$=$	$1.602176487(40) \times 10^{-19} \text{C}$
Vector				μ_{prot}	$=$	$2.792847356(23) \mu_N$
weak:	PCAC	$\langle N' J_{\text{weak}}^\mu N \rangle$	$\longrightarrow$	g_A	$=$	$1.2694(28)$
Axial				g_p	$=$	$8.06(0.55)$
gravity:	$\partial_\mu T_{\text{grav}}^{\mu\nu} = 0$	$\langle N' T_{\text{grav}}^{\mu\nu} N \rangle$	$\longrightarrow$	M_{prot}	$=$	$938.272013(23) \text{MeV}/c^2$
				J	$=$	$\frac{1}{2}$
Tensor				D	$=$	$?$

Proton charge radius

- Back to 2013, a lot of interest on the proton charge radius
- The Proton Radius Puzzle
 - Test theoretical understanding of proton
 - Related to the QCD

Proton charge radius

Proton charge radius

Results from electron-scattering experiments

μp scattering

MUSE @ PSI

- Beams of $e^\pm, \pi^\pm, \mu^\pm$ on liquid H_2 target

- Separate particles by TOF
- Start to taking data: ~2023

- Muon beam:

- 115 – 210 MeV/c
- $\theta: 20^\circ - 100^\circ$

Aim to: 0.5% uncertainty

Amber @ CERN

Compass -> **Amber** (NA66): Apparatus for Meson and Baryon Experimental Research

- A fixed target experiment at M2 beam line
- Beam: **muon**, proton, pion, kaon from **50 GeV to 280 GeV**

Aim to: 1% uncertainty

HIAF muon source

HIRIBL

From 徐宇's talk

- HIAF可以利用~~HFRS~~束线产生缪子束流
 - 动量: $500\text{MeV}/c - 7.5\text{GeV}/c$
 - 产额: $10^6 - 10^7 \mu/s$
 - 束斑大小: $10\text{cm} \times 10\text{cm}$
 - 经过特殊设置, 纯度可以达到100%

HFRS 基本参数

Physics Motivation (liquid hydrogen)

○ Elastic scattering:

- Proton charge radius
- Two photon exchange: μ^+ and μ^-
- Proton charge form factors: (LFU)

○ Advantages:

- Large cross-section: mb
- small scattering angle ($1-10^\circ$)
- momentum measurement of incoming/scattered muon

○ Detector requirements:

- Dipole magnetic field: a few GeV muons
- Precision measurement of particle direction

Physics Motivation (liquid hydrogen)

○ Elastic scattering:

- Proton charge radius
- Two photon exchange: μ^+ and μ^-
- Proton charge form factors: (LFU)

○ Advantages:

- Large cross-section: mb
- small scattering angle ($1-10^\circ$)
- momentum measurement of incoming/scattered muon

○ Detector requirements:

- Dipole magnetic field: a few GeV muons
- Precision measurement of particle direction

Physics Motivation (liquid hydrogen)

○ Elastic scattering:

- Proton charge radius
- Two photon exchange: μ^+ and μ^-
- Proton charge form factors: (LFU)

○ Advantages:

- Large cross-section: mb
- Electron-scattering experiments:
 - the difficulty of producing high-intensity e^+ beams

○ Detector requirements:

- Dipole magnetic field: a few GeV muons
- Precision measurement of particle angle

Physics Motivation (liquid hydrogen)

○ Elastic scattering:

- Proton charge radius
- Two photon exchange: μ^+ and μ^-
- **Proton charge form factors: (LFU)**

○ Advantages:

- Large cross-section: mb
- Resolve tension between PRad and Mainz

○ Detector requirements:

- **Dipole magnetic** field: a few GeV muons
- Precision measurement of particle angle

Physics Motivation (inelastic)

○ Inelastic scattering (resonances):

- Resonance studies
- A clean probe of non-perturbative QCD

○ Reasonable cross-section:

- μb
- momentum measurement of incoming/scattered muon

Physics Motivation (DIS)

○ Deep-Inelastic scattering (DIS):

- PDFs related studies
- Proton structure
- New physics

○ Reasonable cross-section:

- $\mu\text{b} - \text{nb}$
- momentum measurement of scattered muon
- Multiple final states: $\pi^0, \pi^\pm, \gamma, K$

○ Detector requirements:

- Particle-ID: PID

Proton inner structure
DIS, SiDIS, DVCS

Physics Motivation (DIS)

○ Deep-Inelastic scattering (DIS):

- ~~PDFs related studies~~
- Proton structure
- New physics

○ Reasonable cross-section:

- $\mu\text{b} - \text{nb}$
- momentum measurement of scattered muon
- Multiple final states: $\pi^0, \pi^\pm, \gamma, K$

○ Detector requirements:

- Particle-ID: PID

Physics Motivation (DIS)

○ Deep-Inelastic scattering (DIS):

- ~~PDFs related studies~~
 - **Proton structure**
 - New physics
- ## ○ Reasonable cross-section:
- $\mu\text{b} - \text{nb}$
 - momentum measurement of scattered muon
 - Multiple final states: $\pi^0, \pi^\pm, \gamma, K$
- ## ○ Detector requirements:
- **Particle-ID: PID**

○ Semi-inclusive Deep-Inelastic scattering (SIDIS):

- TMD
- ## ○ Small cross-section:
- 100-900 nb
 - Clean environment
 - Less radiation

Physics Motivation (DIS)

○ Deep-Inelastic scattering (DIS):

- ~~PDFs related studies~~
- **Proton structure**
- New physics

○ Reasonable cross-section:

- $\mu\text{b} - \text{nb}$
- momentum measurement of scattered muon
- Multiple final states: $\pi^0, \pi^\pm, \gamma, K$

○ Detector requirements:

- **Particle-ID: PID**

○ Deeply Virtual Compton Scattering (DVCS):

- Proton inner structure
- Gravitational form factor

○ Small cross-section:

- nb
- polarized muon beam
- **motivation for upgrade of HIAF muon source**

Physics Motivation (DIS)

○ Deep-Inelastic scattering (DIS):

- ~~PDFs related studies~~
- Proton structure
- **New physics**

○ Reasonable cross-section:

- $\mu\text{b} - \text{nb}$
- momentum measurement of scattered muon
- Multiple final states: $\pi^0, \pi^\pm, \gamma, K$

○ Detector requirements:

- Particle-ID: PID

○ **New physics:**

○ With Pb as target

- $\mu N \rightarrow \mu N + MET$
- $\mu N \rightarrow \mu\mu\mu N$
- $\mu N \rightarrow \gamma\gamma\mu N$
- $\mu N \rightarrow \mu N' + MET$

Physics Motivation (Quasi-elastic)

○ Quasi-Elastic scattering:

- Coulomb Distortion

○ Target: Copper/Carbon

- Study this from QE to DIS
- Muon has less radiations

Electrons scattering from nuclei can be accelerated/decelerated in the Coulomb field of the nucleus
→ This effect is in general **NOT** included in most radiative corrections procedures
→ *Coulomb Corrections are perhaps more appropriately described in terms of multi-photon exchange, but Coulomb Corrections provide convenient shorthand*

Quasi Elastic scattering
Coulomb Distortion

$W [\text{GeV}]$

Physics Motivation (Other targets)

- Liquid Deuterium (LD_2)
- Helium (3He)
- Motivations:
 - Neutron charge distribution
 - EMC
 - SRC: Short range correlation
 - Form factors

Detector requirements

- Momentum measurement for scattering particles
 - A few GeV charged tracks: cannot use TOF
 - Magnetic fields: solenoid in center region, dipole in the forward region
- Position + angle measurement for incoming/scattering muons
 - silicon pixel detector
- Large detector acceptance, special for small scattering muon
 - Proton charge radius need go down to small Q^2 region: small angle event
- Particle identification
 - Kaon, pion, proton, muon, electron, gamma identifications

First version of Lune Detector

Beam monitoring + forward tracking

Beam monitoring + forward tracking

Multilayer Drift Chamber

Event display: DIS

Elastic scattering: event rate

Projection

- Proton radius measurement needs low momentum muon beam
- Assuming 20 cm LH2 target
 - 15 days @ 1.0 GeV
 - 30 days @ 1.5 GeV
 - 60 days @ 2.0 GeV
- Stat. uncertainty on proton radius:
 - ~ 0.0022 fm (~0.3%)
 - Compared to 1% (Amber), 0.5% (MUSE)

JLab muon facility

Secondary Beams at Jefferson Lab

Strategy and Plans for the Future Experimental Program

Cynthia Keppel

Jefferson Lab Users Organization Annual Meeting

Newport News, VA, June 24-26, 2025

- High-intensity secondary beams are produced in the dump(s) fully parasitically with high-intensity 10 GeV (22 GeV) electron beam

<https://doi.org/10.3390/instruments8010001> (2024)

SECONDARY BEAMS AT JEFFERSON LAB WORKSHOP: BDX & BEYOND

Conference Date
September 04, 2025 to September 05, 2025

Conference Location
Jefferson Lab, CEBAF Center rm. F113

The Secondary Beams at Jefferson Lab Workshop (BDX & Beyond) convenes scientists worldwide, will focus on optimizing the use of intense secondary beams at Jefferson Lab produced by the interaction of high-intensity electron beams with beam dumps, and it is anticipated to produce a White Paper summarizing the findings.

- A secondary muon beam with a bremsstrahlung-like energy spectrum extending up to 5 GeV could yield up to $\sim 10^{-6}$ μ /EOT, corresponding to 10^8 μ /s for an i_e 50 μ A

- A secondary neutrino beam with a typical decay-at-rest (DAR) energy spectrum could provide up to $\sim 7 \times 10^{-5}$ ν /EOT when integrated over a 1 m² detector located 10 m above the beam dump; Considering a delivered charge of 10^{22} EOT per year, the annual neutrino flux would be in the range of 10^{18} ν

13

Jefferson Lab

JLab muon facility

Secondary Beams at Jefferson Lab

Secondary Beams at Jefferson Lab

Only 3 muon beamlines in use today:
SPS/M2 at CERN for COMPASS, the muon
storage ring for $(g-2)\mu$ at Fermilab, and
PiM1 for MUSE at PSI.

There are more planned beams, e.g. at J-
PARC for a $(g-2)\mu$, not included in the
graph.

The potential JLab facility would uniquely
provide muons in a large
range of momenta, while other muon
beams have a small momentum bite.
Fermilab, for example, is fixed to 3.1
GeV/c momentum.

The surface muon beams for material
science are low momentum.

Conclusions and Outlook

- Jefferson Lab offers an exceptional environment for exploring QCD in the non-perturbative regime, combining high luminosity with state-of-the-art experimental facilities. (*Upgrades here, too – see e.g. Keith, Paremuzyan talks Thursday afternoon*)
- Strategic upgrades, like the 22 GeV energy enhancement will expand our reach into uncharted regimes of hadronic physics.
- The development of positron beams is essential to isolating and quantifying two-photon exchange effects, while also enabling symmetry tests and rare process searches that deepen our exploration of the Standard Model and beyond.
- Innovative experiments such as MOLLER, SoLID, BDX, Hall C Hypernuclear and studies at the K-Long Facility will deepen our understanding of nucleon structure, dark sectors, and the role of strangeness in QCD.
- A new facility for muons and neutrinos is attracting new scientific communities to partner with the JLab community and nuclear physics.
- Advanced technology development, such as made possible by the proposed MPGD center, fuels new experiments broadly by allowing for enhanced measurement capabilities with improved resolution and high rate.
- Together, these opportunities signal a dynamic future, one that bridges precision measurements with bold exploration, and keeps Jefferson Lab at the forefront of discovery.

Conclusion

- The **HIAF muon source** offers a unique opportunity to explore new frontiers in **nuclear** and **particle** physics
 - **Proton charge radius**: critical cross-check from muon scattering
 - **Proton inner structure**: DIS, SIDIS, DVCS
 - **Neutron charge distribution**
 - **Nuclear effects**: SRC/EMC, Coulomb Distortion
 - **New physics**: Dark matter searches
- JLab is also planning a muon facility in the coming years
- Outlook: an unexplored research domain @ HIAF muon facility
 - **LUNE collaboration** would like to contribute to it

Conclusion

- The **HIAF muon source** offers a unique opportunity to explore new frontiers in **nuclear** and **particle** physics

- **Proton charge radius**: critical cross-check from muon scattering

- Proton inner structure: DIS, SIDIS, DVCS

- Neutron charge distribution

LUNE is an open collaboration: we warmly invite you to join

- New physics: Dark matter searches

and help shape the future of muon-nucleon physics!!!

- **LUNE collaboration** would like to contribute to it

HIAF: High intensity heavy-ion Accelerator Facility

Track resolution and reco efficiency

Reconstruction/Generators

- **GenFit**: for track reconstruction
 - Experiment independent framework for track reconstruction
 - Also used in PANDA @FAIR, Belle II
- **Rave**: vertex finding and reconstruction
 - A toolkit for vertex reconstruction
 - Developed from CMS
- **K4reco**: cluster reconstruction + PID
 - Marlin algorithms ported to Gaudi, included in **Key4hep**
- **Generators**:
 - esepp (elastic), djangoh (DIS), epic (DVCS), HEPGen++ (DVCS)

PRad-II @ JLab

- Forward acceptance, high resolution EM calorimetry and coordinate detector for tracking
 - Data taking: 2026
- Large angular acceptance:
 - $\theta_e: 0.5^\circ - 7^\circ$
 - $Q^2: 2 \times 10^{-5}$ to $6 \times 10^{-2} \text{ GeV}/c^2$

MAGIX @ Mainz

- Accelerator: 1 mA electron beam, energy up to 105 MeV
- Target: cryogenic supersonic gas jet
 - Effectively point-like target
- Expected precision: $< 0.1\%$

ULQ2 experiment

- Tohoku University: ELPH (Electron photon Science)
- Electron beam energy: from 20 to 60 MeV
- Q^2 : 3×10^{-4} to 8×10^{-3} GeV/c²
- Target: CH₂
- Precision: 0.1%

First beam

Sep. 11, 2020

Commissioning

Sep., Oct., Nov. 2020, May, June, July 2021

Projection

Two photon exchange (TPE)

- Interference between one photon and two photon diagrams: $\ell^\pm$
- Key to resolving the proton form factor discrepancy
 - Rosenbluth vs. polarization transfer methods
- Muon-proton scattering: unique test of lepton universality

Two photon exchange (TPE)

- Electron scattering:
 - JLab, OLYMPUS@DESY, VEPP-3@Novosibirsk
 - Compared e^+p with e^-p elastic scattering
 - TPE at few-% level: explain part of form factor discrepancy
- Muon scattering:
 - Heavier mass: sensitivity to TPE at low Q^2
 - Direct test of TPE universality
- Essential correction for proton charge radius measurement

Proton form factor puzzle

- Over 1% difference for G_E between the **PRad data** and the **Mainz data**
 - Possible reasons: radiative correction? Unknown systematics? Fitting procedure?...
- Large discrepancy also exist for magnetic radius and G_M
 - 0.776(38) fm for Mainz data , 0.914 (35) fm for world data excluding Mainz (G. Lee et al. PRD 92 013013)

WX and Chao Peng (彭潮) *Universe* 9 (2023) 4, 182

Resonance studies

Aspect	ep	μp	Advantage of μp
Beam intensity	$10^{11} - 10^{12}/s$	$10^6/s$	Limited statistics
Radiative correction	Large bremsstrahlung, strong radiative tails that smear resonance peaks	Suppressed bremsstrahlung ($m_\mu \gg m_e$): cleaner resonance signals	Clearer extraction of resonance cross sections
Q^2 Coverage	Wide, but low- Q^2 dominated by radiative effects	Access to lower “effective Q^2 ” region without huge radiative backgrounds	Complementary kinematics
Form Factor/Transition Studies	Extensive measurements at JLab & SLAC	Sparse — essentially unexplored	Opportunity for new data
New Physics Sensitivity	Limited — well tested with electrons	Tests lepton universality, motivated by proton radius puzzle & $g-2$	Unique physics reach

Resonance studies

Proton properties

The structure of strongly interacting particles can be probed by means of the other fundamental forces: *electromagnetic*, *weak*, and (in principle) *gravity*.

em:	$\partial_\mu J_{\text{em}}^\mu = 0$	$\langle N' J_{\text{em}}^\mu N \rangle$	$\longrightarrow$	$Q_{\text{prot}} = 1.602176487(40) \times 10^{-19} \text{C}$
	<i>vector</i>			$\mu_{\text{prot}} = 2.792847356(23) \mu_N$
weak:	PCAC	$\langle N' J_{\text{weak}}^\mu N \rangle$	$\longrightarrow$	$g_A = 1.2694(28)$
	<i>axial</i>			$g_p = 8.06(0.55)$
gravity:	$\partial_\mu T_{\text{grav}}^{\mu\nu} = 0$	$\langle N' T_{\text{grav}}^{\mu\nu} N \rangle$	$\longrightarrow$	$M_{\text{prot}} = 938.272013(23) \text{MeV}/c^2$
	<i>tensor</i>			$J = \frac{1}{2}$
				$D = ?$

P. Schweitzer et al., arXiv:1612.0672, 2016.

The D-term is the “last unknown global property” of the nucleon

extreme weakness of the gravitational interaction

Gravitational form factor (GFFs)

- Nucleon matrix element of Energy-Momentum Tensor (**EMT**) has three scalar form factors

$$\langle p_2 | \hat{T}_{\mu\nu}^q | p_1 \rangle = \bar{U}(p_2) \left[M_2^q(t) \frac{P_\mu P_\nu}{M} + J^q(t) \frac{i(P_\mu \sigma_{\nu\rho} + P_\nu \sigma_{\mu\rho}) \Delta^\rho}{2M} + d_1^q(t) \frac{\Delta_\mu \Delta_\nu - g_{\mu\nu} \Delta^2}{5M} \right] U(p_1)$$

- $M_2^q(t)$: Mass/energy distribution inside the nucleon
- $J^q(t)$: Angular momentum distribution
- $d_1^q(t)$: Forces and pressure distribution

GPDs $\leftrightarrow$ GFFs

GFFs: quark vs. gluon

Quark vs Gluon Contributions to the Nucleon

	Quark GFFs	Gluon GFFs
Partons	u, d, s, ...	gluon
Probe	DVCS, SIDIS, ...	J/ψ , Υ production
Status	JLab, COMPASS, HERA	only recently probed, still with large uncertainties
Structure	Quark “skeleton”	Gluon “binding glue”, nucleon mass
Muon energy	HIAF	HIAF upgrade (photon energy of 8.2 GeV for J/ψ production)

JLab: Nature **615**, 813–816 (2023)

Short range correlation

- **Nuclear structure:** How nucleons are arranged in nuclei at short distances
- **Tensor forces:** How the nucleon–nucleon interaction works at high relative momentum
- **EMC–SRC connection:** Whether nucleon structure modifications (parton distributions in nuclei) originate from short-range nucleon–nucleon dynamics
- **Dense matter physics:** How nucleons behave in environments like neutron stars (where nucleons are packed closer than in normal nuclei)
